Concentrated Gemmotherapy

**Everything
starts from
the bud...your
wellness too!**

*You ask,
nature provides!*

“I founded Nature Provides with a deep inner knowing...that we can reclaim our health and wellness through Nature. Today all of this is possible!”

Jennifer Dayeur

Welcome to Nature Provides.

Perfect synergy of modern phytotherapy and new concentrated gemmotherapy for natural herbals of superior efficacy!

Our Foundation...

We believe that nature plays a significant role in our healing process. We believe that plants are our allies in coming back to our health, wholeness and natural healing, as they teach us about homeostasis - a balance in a restful, peaceful relaxing way of BEing which many of us have lost along our daily path.

We believe that this teaching from nature is a starting point, where past, present and future unite in harmony to offer holistic professionals the best and most credible options that nature provides.

We've built a foundation that aims to introduce innovation by collaborating with the best companies in the field of natural therapies, having over 30 years of experience in this sector.

This allows us to offer the best supplements that combine the most effective phytotherapy with modern gemmotherapy to fully meet the needs of each professional.

We started from concentrated gemmotherapy to broaden our horizons to the entire range of herbal supplements.

You ask, Nature Provides.

Nature Provides:

the concentrated gemmotherapy that enhances classic phytotherapy's effectiveness.

#NatureProvides Nature Provides offers integrative practitioners a professional line of herbal supplements called PSC (Plant Stem Cells). These products are obtained exclusively from plant buds, rootlets and young shoots, thus defined as gemmotherapy. PSC concentrated gemmotherapeutic extracts are highly potent and enhance the effectiveness of classic herbals.

#Gemmotherapy Gemmotherapy's uniqueness lies in the purifying, regenerating and vital energy present in the active principles that originate from the new growth phase of plant stem cells. Its main action is the ability to drain toxins accumulated in the body due to health disorders, poor diet, and environmental pollution, in order to naturally direct them to the excretory organs.

#Drainage Metabolic waste puts increased stress on our body, preventing it from carrying out its routine functions and restoring its own levels of physiological well-being. Biotherapeutic drainage intervenes by purifying the body and restoring its entire physiological functional balance.

PSC gemmos:

one more tool in Practitioners hands.

The ideal use of gemmotherapeutic extracts is combined with classic herbal medicine protocols because they are capable of amplifying and improving the effectiveness of the therapies due to their draining, regenerating and energizing potential. This is why PSC supplements are a vital tool in the practitioners hands.

What are the advantages and uniqueness of embryonic plant stem cells (PSCs)?

PSCs carry all the genetic information of the entire future plant

PSCs contain a significant amount of embryonic plant stem cells

PSCs contain more anti-inflammatory omega 3 fatty acids

PSCs contain more enzymes due to intense phases of cellular growth

PSCs are regenerative

PSCs' embryonic tissue collection does not destroy or endanger any plant species

PSCs are non-toxic as they have yet to interact with environmental pollutants

PSCs are never adulterated or isolated

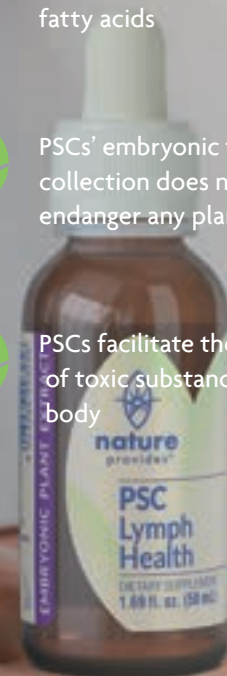

PSCs facilitate the extraction of toxic substances from the body

PSCs are expert hormonal modulators for endocrine imbalances

PSCs contain higher amounts of anti-inflammatory fatty acids, amino acids (AA), nucleic acids (NA), growth hormones (GH), immune hormones (IH), embryonic plant stem cells (EPSC) and biophotons than adult plants

How are PSC

concentrated extracts made?

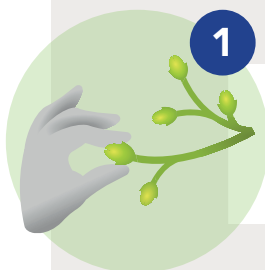

We use only fresh plant tissue (never dried or frozen) and utilize an exclusive **Spagyric** extraction method, based on ancient bioenergetic principles, combined with the most modern laboratory techniques.

Plant tissue is combined with organic solvents for maceration. Plants are extracted with organic grape alcohol 60% and organic vegetable glycerin.

Grape alcohol is 100% free of contaminants, including toxic metals and allergens; contrary to most plant extracts made with alcohol solvent derived from genetically modified (GMO) corn. We never modify, cut or crush tissue; it is undiluted, unadulterated and never isolated. The materials are macerated for 21-28 days then gently pressed to squeeze all juices. Residual tissues are burnt and their

ashes (which contain oligo-elements) returned into the extract and then filtered. This is to ensure that nothing is lost and to provide a full-spectrum dietary and phytochemical composition. In-house and independent toxicological testing is performed on every batch, which is then allocated a lot number and an expiration date. This process is repeated to ensure consistency and quality in every drop of our extracts.

The production process

1

Collection

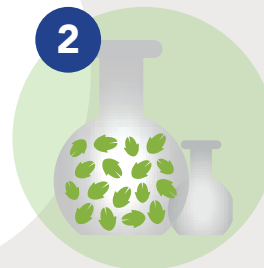

The buds, certified ORGANIC, are collected in spring in areas far from polluting sources and subjected to careful cleaning.

3

Quality check

After decanting, filtration and calcination, the extracts are subjected to strict quality controls.

2

Maceration

The embryonic tissues are freshly macerated for 3 weeks to keep their properties intact and to ensure all of the benefits available and utilized for the well-being of the organism.

4

Finished product

At the end of the processes listed above, the extracts are bottled and ready for storage and distribution.

Quality & Research

Our added value!

The starting point for a high quality, effective and safe product is the selection of raw materials. At Nature Provides we strictly exclude from our formulations ingredients that do not have a proven safety certified by strict quality controls throughout the entire supply chain. The plants are macerated within 12 hours from harvest to preserve their power and energy. We guarantee that all phytochemicals and biological activities are present and preserved in order to produce supplements with profound benefits for the body. Our **Research and Quality** laboratory plays an active role in monitoring the processing of the extracts using state-of-the-art scientific equipment to ensure the highest quality in every production phase. We have:

HPLC

(High Performance Liquid Chromatography) equipment for the identification of active ingredients and any impurities in the and finished extract

HPTLC

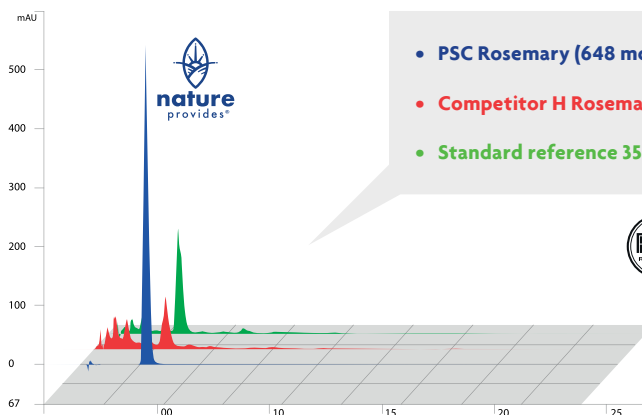

(High Performance Thin Layer Chromatography) methods for qualitative identification of plant species

FT-NIR

(Near InfraRed spectroscopy) is an analysis method that uses the NIR region of the electromagnetic spectrum (800 - 2,500 nm) for measurements of extracts constituents

nature provides®

Products overview

What Nature...provides:

The single supplements are obtained by processing the tissues of a single plant. The complexes are the result of a combined formulation of parts of several plants. Both lines support the physiological recovery of the organism on multiple problems and are developed specifically for practitioners. Blends combine Spagyric adult plant tinctures and concentrated PSCs.

Concentrated Singles

100% PROFESSIONAL GEMMO EXTRACT

Single extracts allow a complete personalization of the supplementation based on a patient's specific needs and may exclude the use of plants not suitable for the single intervention.

Concentrated Complexes

100% PROFESSIONAL GEMMO EXTRACT

Complexes allow a greater speed in the choice of the remedy because they are able to simultaneously cover several aspects and causes of the health concern.

Effective supplements for:

CARDIAC WELLNESS

EPIDERMIS

BLADDER

UTERUS

SPORT AND ENERGY

GYNECOLOGY

LYMPHATIC

PULMONARY

DIGESTION

IMMUNE SYSTEM

MUSCULAR & SKELETAL

METABOLIC

SLEEP

ANXIETY STRESS

PSC SINGLES remedies

100%  PROFESSIONAL
GEMMO EXTRACT

Professional Guide

PSC REMEDIES: The purifying and regenerating power of gemmos!

Nature Provides offers a professional line of natural remedies called PSC (Embryonic Plant Stem Cells) with two specific lines: Singles and Complexes.

PSC remedies are made with the embryonic tissues of plants or buds. In the buds, there is an inexhaustible “vital energy”, which is necessary for the regeneration and development of the plant. This energy, combined with the substances contained in the embryonic tissues, are the basis of gemmotherapeutic remedies that naturally support the organism by purifying it and restoring balance and well-being to its organs and their functions.

Thanks to PSC concentrated remedies, the practitioner has an additional tool available to make natural and phytotherapeutic protocols and approaches even more effective starting with drainage and purification.

What do embryonic tissues contain?

- DNA and RNA nucleic acids
- amino acids enzymes
- proteins
- minerals
- micropolipeptides
- oil-trace elements
- vitamins
- antioxidants
- juvenile phytohormones

SINGLE PSC remedies: Natural ingredients with targeted action!

The specificity of a SINGLE remedy lies in the precise action of its ingredient. Each plant and consequently each of its buds has specific properties that allow it to support in an exclusive way the physiological restoration of the function of a particular part of the organism. Once the patient’s clinical status has been precisely defined, the professional, through the SINGLE remedies, has a direct and targeted tool for intervention on the organ and on the problem.

In summary, the main features of a SINGLE remedy are:

- specific action on a specific part of the organism
- high level of effectiveness in responding to the problem identified
- targeted draining gemmotherapeutic action (drainage)
- high level of compliance with therapy

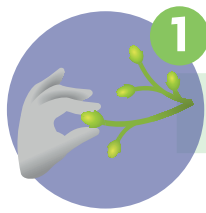

FOCUS: organ - by - organ specific “Drainage”

Drainage is the specific purification action of the organism carried out through the use of PSC remedies. In fact, drainage means “gemmotherapeutic drainage” and intervenes by triggering an intra cellular and extra cellular purification process that leads to re-establishing the physiological levels of well-being and functionality of the body.

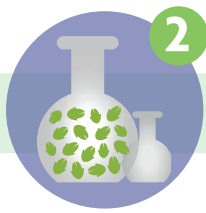

Metabolic waste puts our organism under stress, which as a consequence, causes it to struggle to carry out its normal processes correctly.

How is it made? Respect for nature: from picking to packaging!

Collection

The gemmos, certified ORGANIC, are collected in Spring in areas far from polluting sources and subjected to careful cleaning.

Maceration

The embryonic tissues are freshly macerated for 3 weeks to keep their properties intact and guarantee all the benefits useful for the well-being of the organism.

Quality check

After decanting, filtration and calcination, the extracts are subjected to strict quality controls.

Finished product

At the end of the processes listed above, the extracts are bottled and ready for storage and distribution.

Research and Quality: Our added value!

Our Research and Quality laboratory plays an active role in monitoring the processing of the extracts using state-of-the-art scientific equipment to ensure the highest quality in every production phase. We have:

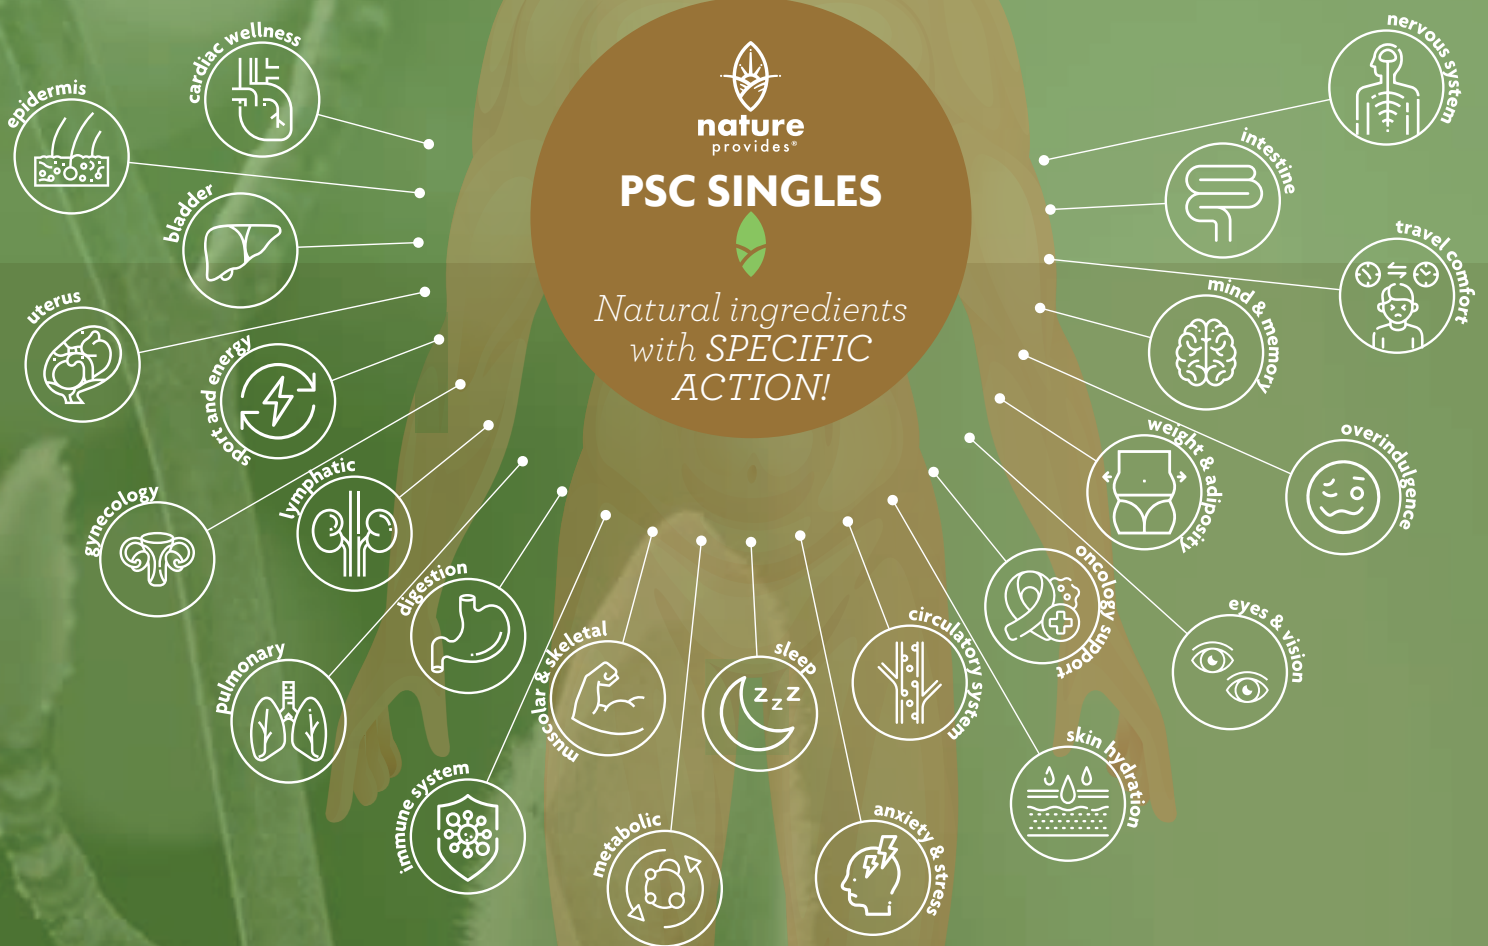

- HPLC high performance liquid chromatography equipment for the identification of active ingredients and any impurities of raw materials and finished products
- equipment for microbiological examinations
- atomic absorption test for the identification of heavy metals

All aspects of our production processes are certified

Nutritional applications

Each embryonic plant cell extract contains a composite and specific phytocomplex made of many molecules, which contribute to exert distinctive activities. Thus PSC SINGLES involve the whole body and can be used in the most diverse fields of clinical nutrition: dermatology, gynecology, hematology, oncology, infectious disease, pediatrics, psychiatry, to name a few

How do you determine which plant to use for the patient?

Each plant exerts a specific organotropism (affinity for particular organs, organ systems or somatic tissues) that helps determine which plant to use for the patient, depending on what the imbalance, dysfunction or condition is that needs to be regulated. Embryonic Plant Stem Cell Extracts will balance the specific body's function by stimulating elimination of waste substances, restoring internal homeostasis and promoting normal biochemical processes.

How to calculate the dosage for each person?

The standard dose of administration is indicated on the label and is indicative for a subject over 12 years of age and of standard weight. Typical dosage is 3 times per day. It is possible, however, to double the dose in acute cases. For people under the age of 12, calculate the dose to be administered in proportion to weight. In the case of gemmo extracts, it is recommended to take 1 drop for every 4 pounds of body weight. If it is necessary to combine two or more single remedies with each other, the dose of administration must be maintained at the standard levels indicated on the label for all products forming part of the protocol.

PSC Arnica 1:10

- EXTERNAL USE ONLY -

Components

- Arnica (Arnica Montana) organic fresh buds extract (1:10)
